Website Monitoring Suite

Demo report and bug findings

25 September 2026 · Syed Shah · Repo: github.com/syed12-u/daily-site-checks

The monitoring suite is built and verified against all four sites (perhaps.com, flexoffers.com, fusetwo.com, incubators.com). It runs 43 automated checks per site every day on desktop and mobile viewports, retries failures before alerting, and posts results to a Microsoft Teams channel. Two real defects on flexoffers.com were caught during verification.

1. What is checked

Every scenario has a pass condition and a severity. Critical and High failures post to Teams immediately; Medium and Low appear in the daily summary card.

Family	IDs	What it verifies	Severity on fail
Availability	AV-01 to AV-08	Homepage HTTP 200 within 5 s over HTTPS; every key page responds; www and http redirect to the canonical URL with 301; TLS certificate valid and more than 14 days from expiry; DNS records unchanged; branded 404 page; robots.txt and sitemap parse; every URL in the sitemap responds (AV-08, added beyond the plan: 3,972 URLs on flexoffers.com, HTTP only)	Critical to Low
Functionality	FN-01 to FN-09	Every visible link on the homepage returns 200 (up to 150 links); no broken images on key pages; contact form renders with its fields; contact form submits in test mode; search returns results; login page rejects wrong credentials with a message, not a 500; publisher and advertiser signup forms render; Google Tag Manager and HubSpot load; primary CTAs are enabled and link to a 200 page	Critical (login) to Low
Error detection	ER-01 to ER-06	Zero uncaught JavaScript errors; no failed first-party requests; no mixed content; no "Lorem ipsum", "undefined", "null", stack traces or template placeholders visible; brand in homepage title, H1 present, key phrases present; HSTS, X-Content-Type-Options and frame protection headers	High to Low
Performance	PF-01 to PF-05	Time to first byte under 800 ms; Largest Contentful Paint under 2.5 s desktop and 4 s mobile; homepage under 3 MB and not more than 25% heavier than yesterday; request count not up more than 25%; response time not more than 50% above the 7-day average	Medium, Low
User flows	UF-01 to UF-07	Home to contact form filled; home to primary CTA to landing page with H1 and CTA; publisher signup validates required fields; advertiser signup validates; invalid login shows an error and the page stays usable; browse or search to a result page; mobile hamburger menu opens and a link loads	Critical (login) to Medium
Visual regression	VR-01 to VR-08	Full-page screenshot vs approved baseline, desktop and mobile (0.2% pixel threshold); homepage hero (0.1%); header and footer pixel-exact; nav, H1, CTA and footer moved more than 10 px; visible text changes; font and colour drift on key elements; expected sections present and non-empty	High to Low

Site-specific: login, publisher signup and advertiser signup run on flexoffers.com only; search and browse run on flexoffers.com and incubators.com. Dynamic regions (cookie banners, chat widgets, carousels, dates, ad slots) are masked before screenshots, and cookie consent is accepted or hidden before every check.

2. How it works

A scheduler starts one Node script. It runs the Playwright suite against the four sites, retries anything that failed twice with 60 seconds between attempts so a network blip never alerts anyone, works out severity, and posts to Teams.

1. Task Scheduler fires at 08:00 daily (full run) and every hour (homepage ping).
2. src/run.js runs the Playwright suite: 4 sites, desktop and mobile viewports.
3. Failed checks are retried twice, 60 s apart; only persistent failures count.
4. Results are saved to runs/<date>/ (results.json, HTML report, screenshots, diffs).
5. Critical and High failures post to Teams at once; Critical repeats hourly until it passes again.
6. A daily summary card follows, and a weekly uptime and speed roll-up every Monday.

Part	File	Role
Site config	config/sites.js	Pages, selectors, flows, masks per site; a missing block skips its scenario with a reason
Tests	tests/availability, errors, performance, functionality, flows, visual, sitemap .spec.js	The 43 scenarios; test titles carry the scenario ID and site
Daily run	src/run.js	Run, retry, merge, publish, alert, daily and weekly cards, prune 30 days
Hourly ping	src/uptime.js	Homepage check per site; re-checks open Critical alerts
Teams	src/teams.js	Adaptive Cards over an incoming webhook
Baselines	src/approve.js	Approve an intended visual change: npm run approve <site> <page>
Scheduler	scripts/register-tasks.ps1	Registers the Windows tasks
Runbook	README.md	Add a page, silence a check, rerun, approve

3. Verification done so far

Run	Scope	Result
Full smoke run, 24 Sep	All 4 sites, 248 test instances, desktop and mobile	Pipeline works end to end: results, summary, alert state and Teams cards (saved locally; webhook not yet set). 12 selector and timing problems found and fixed.
Headed demo run, 25 Sep	flexoffers.com, functionality and user-flow checks, visible browser	14 of 14 applicable checks pass after fixes (links, images, contact form, search, login, publisher and advertiser signup, embeds, CTAs, all flows). 2 skipped by design: form submit waits for a safe test mode.
Sitemap check, 25 Sep	incubators.com (12 URLs), fusetwo.com (73 URLs)	All URLs return 200; 12 URLs in 1 s, 73 in 7 s.

Page lists were taken from each site's sitemap and navigation rather than guessed: 9 pages on perhaps.com, 10 on flexoffers.com, 9 on fusetwo.com, 5 on incubators.com. Canonical hosts were confirmed (www for perhaps, flexoffers and fusetwo; apex for incubators).

Not yet verified: contact-form submission (needs a test mode per site), the fusetwo.com lead form (no contact page in its sitemap), and Teams delivery (needs the webhook URL).

4. Bugs found on the live sites

BUG-1: Uncaught JavaScript error "wp is not defined" on every page of flexoffers.com

Severity: Medium (ER-01 Console errors). Affects all 10 monitored pages, on every load.

Test case: ER-01 Console errors, tests/errors.spec.js

Environment: Chrome 128 (Playwright Chromium), desktop 1440x900, 25 Sep 2026

Steps to reproduce:

7. Open https://www.flexoffers.com/ in Chrome.
8. Press F12, open the Console tab, reload the page.
9. Observe: ReferenceError: wp is not defined at wp-i18n-js-after:2:1.

Expected: no uncaught errors on page load.

Actual: the inline script with id wp-i18n-js-after runs wp.i18n.setLocaleData(...) but the WordPress wp-i18n script is not loaded before it (missing script dependency, or an optimisation plugin that defers or removes wp-i18n).

Impact: any block or plugin relying on wp.i18n after this point fails silently; the error appears in every visitor's console.

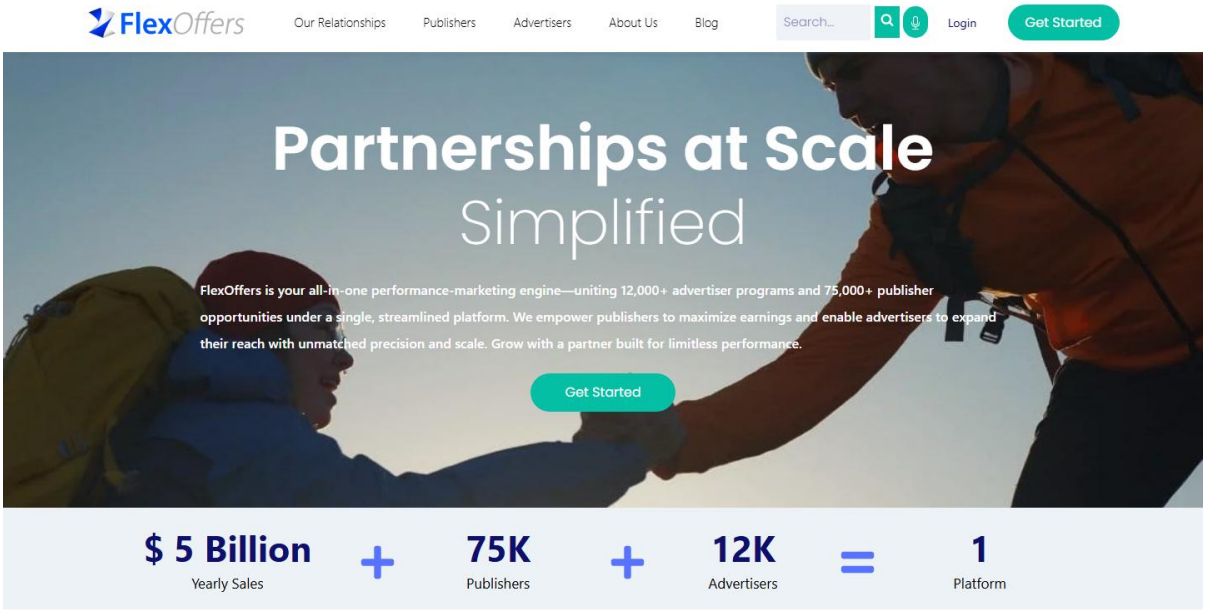

Figure 1. flexoffers.com homepage at the moment the error fires (console text: ReferenceError: wp is not defined at wp-i18n-js-after:2:1).

BUG-2: /advertisers/ page has no H1 heading

Severity: Medium (ER-05 reports it High per plan; SEO and accessibility impact, no visual impact).

Test case: ER-05 Expected content present, tests/errors.spec.js

Steps to reproduce:

10. Open https://www.flexoffers.com/advertisers/.
11. Press F12, Console, run document.querySelectorAll('h1').length.

12. Observe: 0. The hero title "The Advertiser Platform Powered by Trusted Partnerships" is an <h2>.

Expected: exactly one H1 per page (every other monitored flexoffers.com page has one).

Actual: hero heading rendered as H2; search engines and screen readers get no page-level heading.

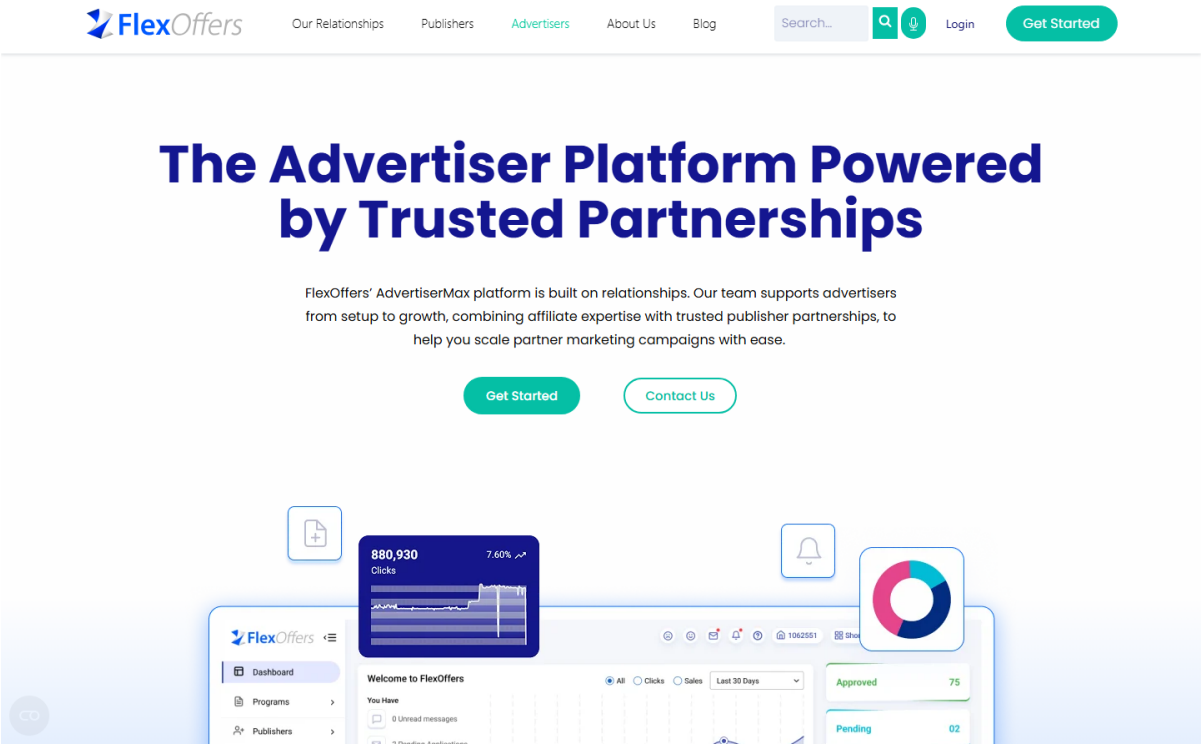

Figure 2. /advertisers/ page; the visible title is an H2, no H1 exists in the DOM.

Informational findings (Low, listed in the daily card only)

Site	Finding	Check
All four	Strict-Transport-Security header missing; X-Content-Type-Options missing on perhaps, fusetwo, incubators; frame protection missing on fusetwo and incubators	ER-06
flexoffers.com	Homepage title is "Performance-Based Marketing" with no brand name	ER-05
fusetwo.com	Uncaught error "Cannot read properties of null (reading 'offsetHeight')" on 9 pages	ER-01
flexoffers.com	Cookiebot dialog contains an unrendered placeholder link [#DSR_FORM_URL#] (hidden, not user-facing)	FN-01

5. Scheduling and hosting

Recommendation: register the Windows scheduler on the laptop today so the daily run starts tomorrow, and move the same two commands to Azure within two weeks for reliable hourly alerts and hosted screenshots.

Option	Setup	Daily run at 08:00	Hourly outage alerts	Screenshots in Teams cards	Cost
Laptop, Windows Task Scheduler	Ready now: scripts/register-tasks.ps1 -DailyTime 08:00	Yes; if the laptop is off at 08:00 the run starts as soon as it wakes	Only while the laptop is on	Text only, unless the run folder is synced to a shared location with a URL	None
Azure VM (small B-series)	Same repo, same scheduler or cron; about half a day	Yes, every day	Yes, 24 hours	Yes, via an Azure Blob container with a public URL	About 15 to 30 USD per month
Azure DevOps or GitHub Actions scheduled pipeline	YAML cron, Playwright container; about one day	Yes	Yes	Yes, artifacts uploaded to Blob	Minutes-based, low

Why not stay on the laptop: the plan promises a Critical alert within five minutes and a repeat every hour until fixed; a laptop that sleeps misses those windows, and the office network hides outages that only affect outside users. UptimeRobot (already connected) can cover external pings in the meantime.

How the report reaches the team: in the Teams channel, open Workflows and choose "Post to a channel when a webhook request is received"; paste the URL into .env as TEAMS_WEBHOOK_URL. The daily card, immediate alerts and the Monday roll-up all go to that channel. A Teams group chat works the same way with the same template.

6. Still needed and next steps

The code is complete; four inputs from other teams gate the go-live. Teams posting is built and tested locally and switches on the moment the webhook URL is pasted into .env.

Need	Why	Owner	Needed by
Teams channel or group webhook URL (Workflows)	Nothing posts without it; enables daily card, alerts, weekly roll-up	Teams admin	Mon 28 Sep
Test account or hidden test field for flexoffers.com forms and signup	Lets FN-04 and UF-01 submit without creating real leads	FlexOffers product	Mon 28 Sep
Which page carries the fusetwo.com lead form	Enables contact checks on fusetwo	Site owner	Mon 28 Sep
Always-on runner (Azure VM or pipeline) and a Blob container for reports	Hourly alerts and screenshots in cards	IT / DevOps	Wed 30 Sep
Allow-list the runner's IP on Cloudflare or WAF	Avoid bot challenges causing false failures	DevOps	Wed 30 Sep
GitHub push access from the runner	Baseline commits and shared history	Syed	Mon 28 Sep

13. Fri 26 Sep: register the laptop scheduler at 08:00, run npm run approve all all to capture the first baselines, review them.
14. Mon 28 Sep: webhook live; first real daily card in the channel; site owners confirm page lists.
15. Wed 30 Sep: two clean daily runs reviewed, thresholds and masks tuned, Azure runner decided.

16. Fri 2 Oct: handover: runbook walkthrough, plan document updated with the final page lists.
